Authentication and authorization state data in code in blazor

In our previous video we discussed, how to use `[Authorize]` attribute to authorize access to routable components (i.e components with `@page` directive). We did this in the component html.

In this video we will discuss, how to obtain authentication and authorization state data in code in blazor.

Cascading AuthenticationState parameter

- Cascading `AuthenticationState` parameter (`Task<AuthenticationState>`) provides authentication and authorization state data.
- If the user is not authenticated, the request is redirected to the `login` page.
- The return url is also passed as the query string parameter to the login page.
- Upon successful login, the user will be redirected to the page he was trying to access.

Check if authenticated user is in a specific role

```
if (authenticationState.User.IsInRole("Administrator"))  
{  
    // Execute Admin logic  
}
```

Check if authenticated user satisfies a specific policy

`Task<AuthenticationState>` can be combined with `IAuthorizationService`, to check if a specific aothorization policy is satisfied.
